Center for Water-Energy Efficiency  
University of California, Davis

## Scales of Operation

## Scales of Operation

## Operational and Management Responsibilities

- Source Selection
  - Ground water, surface water, wholesale, recycled **purchasing or production**
- Reservoir Management
  - **Local storage** for drinking, fire flow, etc.
- Pump Scheduling
  - **Rotation of lead pump** at pumping stations, planning for maintenance/emergency
- Leak Detection
  - SB555, **Water Loss Control** and Auditing
- Pressure Management
  - **Delivery, leak control, energy intensity, etc.**
- Water Quality
  - **Chlorine residual**, nitrification monitoring, water age
- Demand Response
  - Capacity to or plan to **reduce energy demand** and specific hours

## Impact on Daily Operations and System Planning

- Reservoir Management
  - **System operation** by scheduling the filling or draining utilizing **pump stations**
- Pump Scheduling
  - **System operation with** efficient pumps, or participation in Demand Response
- Leak Detection
  - **System planning and operations** with District Metered Areas, AMI, Ultrasonic Detection
- Pressure Management
  - **System planning** to reduce pressure where appropriate
- Demand Response
  - **System operation** to reduce demand when beneficial

## Hydraulic Modeling

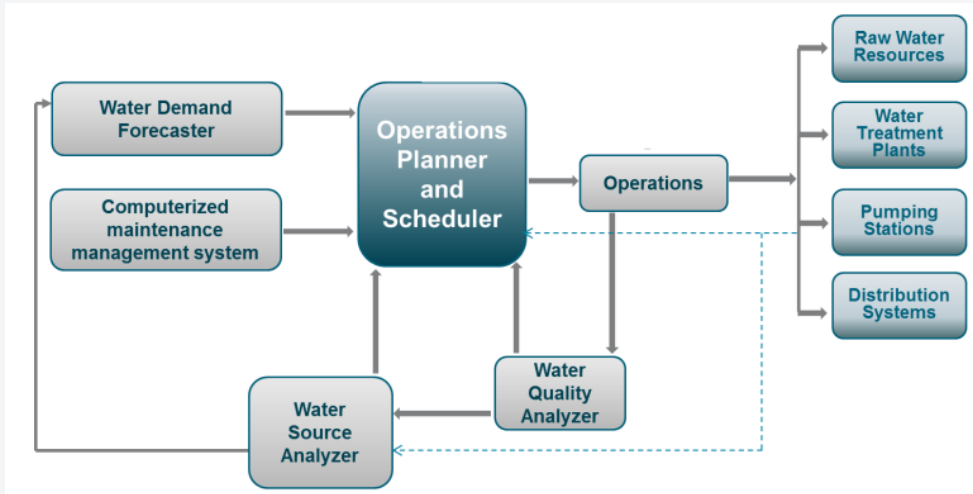

- Software that uses first principles of engineering (mass balance, energy balance) to simulate hydraulic and water quality at water distribution systems
- EPANet & SWMM – 2002
- EPANet-MSX – 2008 (last stable release)
- EPANet-RTX – 2015
- Bentley: WaterGems, WaterCAD
- Innovyze: InfoWater
- DHI: MikeUrban
- Derceto: Aquadapt

## Energy and Water Quality Management System

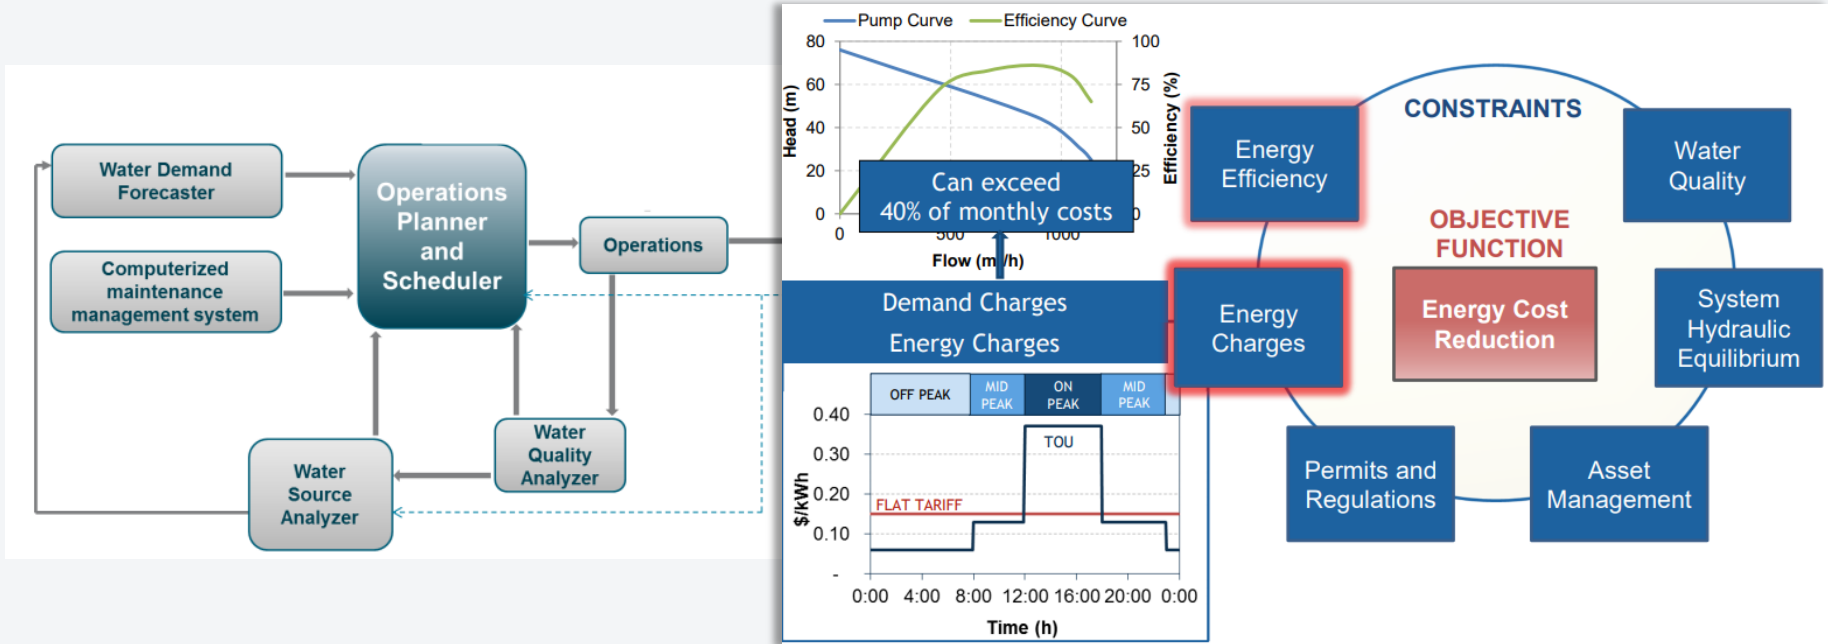

- All stakeholders interested in software to optimize water system operations
  - Dozens of pilots world-wide, no killer app yet
- Requires accurate hydraulic model and data sources
  - Dedicated effort to maintaining GIS records
  - Direct relationship between SCADA and GIS
- Requires significant trust from operators
  - Hydraulic model operations matching field
  - **Recommendation consistency**
- Must reflect operations and availabilities *now*, not just typical
  - Pump Station Maintenance
  - Reservoir rollover

# *A Day in the Life of a Water System Operator*

**Robert Good**

---

Center for Water-Energy Efficiency  
University of California, Davis

## Introduction

You will be acting a **day-in-the-life** of an Operator

As an operator, your objective is to **provide water to customers** when they want it.

**You can choose** how much water to purchase each hour and put into your system.  
**The cost will vary depending on the hour**

Your customers will drink from your purchased water immediately  
– **any they don't drink will be stored in a tank.**

If you don't supply enough water, **the customers will drink from the tank.**

# How to Operate your Water System

Buying water will **cost you money**,  
But your customers will **pay you** if you get them their water!

If the you don't have enough water, you **will receive a penalty!**
